Using Subqueries to Solve Queries

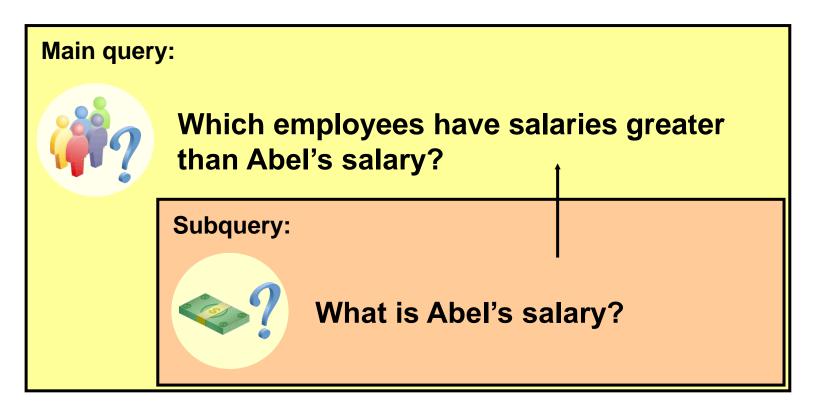

Objectives

After completing this lesson, you should be able to do the following:

- Define subqueries
- Describe the types of problems that subqueries can solve
- List the types of subqueries
- Write single-row and multiple-row subqueries

Using a Subquery to Solve a Problem

Who has a salary greater than Abel's?

Subquery Syntax

```
SELECT select_list
FROM table
WHERE expr operator

(SELECT select_list
FROM table);
```

- The subquery (inner query) executes once before the main query (outer query).
- The result of the subquery is used by the main query.

Using a Subquery

```
SELECT last_name
FROM employees
WHERE salary >

(SELECT salary
FROM employees
WHERE last_name = 'Abel');
```

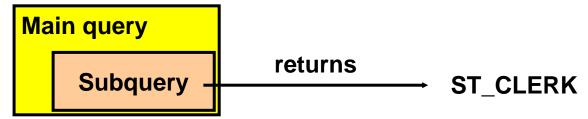

LAST_NAME
King
King Kochhar De Haan
De Haan
Hartstein Hartstein
Higgins

Guidelines for Using Subqueries

- Enclose subqueries in parentheses.
- Place subqueries on the right side of the comparison condition.
- Use single-row operators with single-row subqueries, and use multiple-row operators with multiple-row subqueries.

Types of Subqueries

Single-row subquery

Multiple-row subquery

Single-Row Subqueries

- Return only one row
- Use single-row comparison operators

Operator	Meaning
=	Equal to
>	Greater than
>=	Greater than or equal to
<	Less than
<=	Less than or equal to
<>	Not equal to

Executing Single-Row Subqueries

```
SELECT last name, job_id, salary
FROM employees
                               ST_CLERK
WHERE
       job id =
                (SELECT job id
                 FROM
                       employees
                 WHERE employee id = 141)
AND
       salary >
                                  2600
                (SELECT salary
                        employees
                 FROM
                        employee id = 143);
                 WHERE
```

LAST_NAME	JOB_ID	SALARY
Rajs	ST_CLERK	3500
Davies	ST_CLERK	3100

Using Group Functions in a Subquery

```
SELECT last_name, job_id, salary
FROM employees
WHERE salary = 
(SELECT MIN(salary)
FROM employees);
```

LAST_NAME	JOB_ID	SALARY
Vargas	ST_CLERK	2500

The HAVING Clause with Subqueries

- The Oracle server executes subqueries first.
- The Oracle server returns results into the HAVING clause of the main query.

```
SELECT department_id, MIN(salary)
FROM employees
GROUP BY department id
HAVING MIN(salary) >

(SELECT MIN(salary)
FROM employees
WHERE department_id = 50);
```

What Is Wrong with This Statement?

```
ERROR at line 4:
ORA-01427: single-row subquery returns more than
one row
```

Single-row operator with multiple-row subquery

Will This Statement Return Rows?

```
no rows selected
```

Subquery returns no values.

Multiple-Row Subqueries

- Return more than one row
- Use multiple-row comparison operators

Operator	Meaning
IN	Equal to any member in the list
ANY	Compare value to each value returned by the subquery
ALL	Compare value to every value returned by the subquery

```
SELECT last_name, salary, department_id

FROM employees

WHERE salary IN (SELECT MIN(salary)

FROM employees

GROUP BY department_id);

SELECT last_name, salary, department_id

FROM employees

WHERE salary IN (2500, 4200, 4400, 6000, 7000,8300, 8600, 17000);
```

Using the ANY Operator in Multiple-Row Subqueries

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
124	Mourgos	ST_MAN	5800
141	Rajs	ST_CLERK	3500
142	Davies	ST_CLERK	3100
143	Matos	ST_CLERK	2600
144	Vargas	ST_CLERK	2500

10 rows selected.

Using the ALL Operator in Multiple-Row Subqueries

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
141	Rajs	ST_CLERK	3500
142	Davies	ST_CLERK	3100
143	Matos	ST_CLERK	2600
144	Vargas	ST_CLERK	2500

Summary

In this lesson, you should have learned how to:

- Identify when a subquery can help solve a question
- Write subqueries when a query is based on unknown values

```
SELECT select_list
FROM table
WHERE expr operator

(SELECT select_list
FROM table);
```

Practice 6: Overview

This practice covers the following topics:

- Creating subqueries to query values based on unknown criteria
- Using subqueries to find out which values exist in one set of data and not in another
